¹We calculate voter turnout by dividing the estimated number of votes cast by estimated total citizen population. We gather data from three sources: **Exit Polls** to estimate the youth vote share, which is in turn used to calculate the number of youth votes cast (% youth share x total votes cast, based on **Federal Election Commission** reporting); **The American Community Survey** to estimate youth citizen population.

The bar graph below shows vote 2006-2014. For 2012 and 2014, we can provide youth vote counts tallies from Catalist (which aggregates voter file information) and we include them here because the voter file is the most accurate data source about vote counts than any survey measure. For the states that have age-related data available, the bar graph also displays the youth vote counts. Other estimates in the graph are from Census Current Population Survey (CPS). The line graphs track the CPS-based voting and registration trends by age over time and how they track with the national average. We recommend only using line graphs to understand trends and calculating or estimating or specifying the percentage estimates by looking at the line graph.
